

High-temperature growth in *C. auris* is discordant with phylogenomic proximity

A Phylogeny

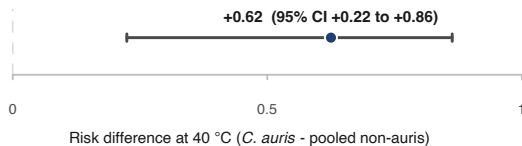

0.2 subs site⁻¹

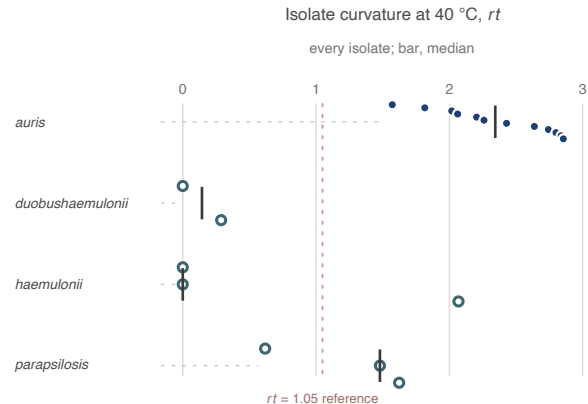

B Thermal phenotype aligned to phylogeny

D 40 °C contrast (count-based)

C Continuous curvature contrast

Growth at 40 °C does not track relatedness

$d = 0.33\text{--}0.35$ subs/site to nearest relatives; 12/12 vs 3/8 isolates grew

Counts: Fisher $P = 0.004$; curvature: Mann-Whitney $P = 0.001$
