

# High-temperature growth in *C. auris* is discordant with phylogenomic proximity

## A Phylogeny

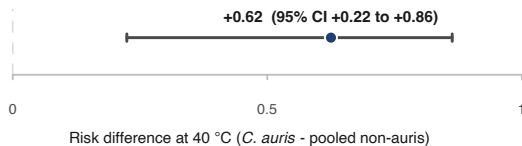

## B Thermal phenotype aligned to phylogeny

## C Continuous curvature contrast

## D 40 °C contrast (count-based)

### Growth at 40 °C does not track relatedness

$d = 0.33$ – $0.35$  subs/site to nearest relatives; 12/12 vs 3/8 isolates grew

Counts: Fisher  $P = 0.004$ ; curvature: Mann-Whitney  $P = 0.001$
